

monitor & SMS alert™

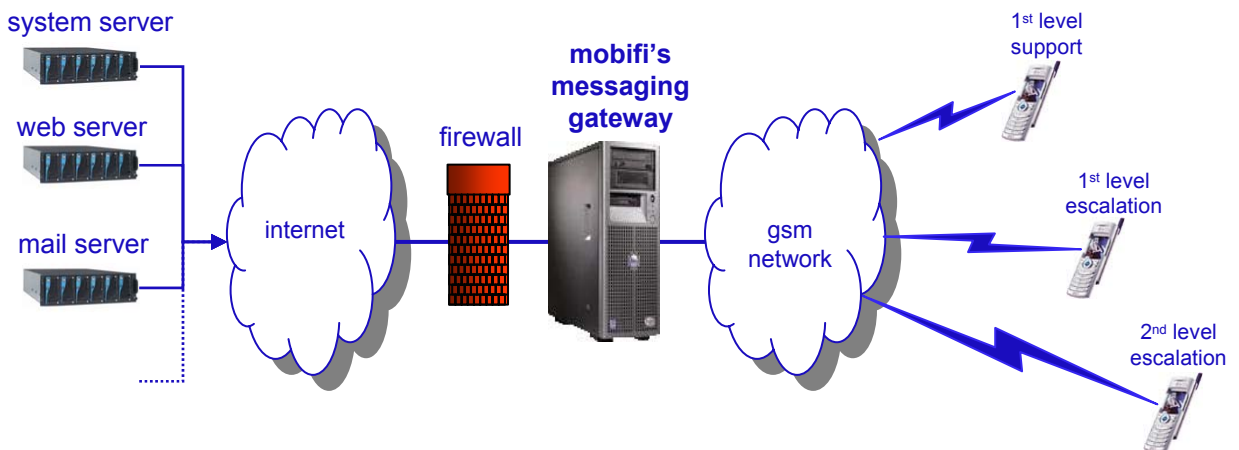

The SMS Monitor & Alert™ service allows Mobifi to monitor your organisation's servers via the Internet and as soon as a server stops responding, an SMS text message alert is sent to the administrator's mobile phone. The SMS Monitor & Alert™ service is run from Mobifi's own servers without the need for your organisation to install any new software or hardware on your network.

By accessing the administrator's user interface via your web browser, you select which servers you would like us to monitor, which members of staff you'd like us to forward alerts to and whether you want us to forward SMS text or email messages, or both. You control your settings and can make amendments at any time.

You can remotely monitor any of your critical servers such as:

- Web
- SMTP Mail
- Database
- FTP
- Telnet
- DNS

This is a very comprehensive and flexible monitoring and alerting service which has been designed for any organisation, regardless of size, looking to monitor its servers efficiently, effectively and with value in mind. Its value proposition is that it provides an all-in-one service offering both advanced monitoring and SMS alerting. A white label version for large companies or resellers is available.
